July 12, 2012

1 Installing Pliik

1.1 CouchDB

Pliik is a [Couchapp](#) served directly from a CouchDB instance.
Both the source code and the application data are stored at the persistence layer.

First step is to get a CouchDB instance up and running.
You can choose to:

- Install your own CouchDB instance - [CouchDB Installation](#) (*i*=1.1.x)
- ... or to get one from the web at [Iris Couch](#)

2 Localization

2.1 Starting the engine

In Pliik this is all achieved at the config Object.

```
beginverbatim sdsdfs sdfsdfs endverbatim
```

1. FILE:js/config

```
lang.getActiveCode( config ) Search URL, process default Set require locale  
config option
```

2. Core Engine

After setting the proper require.config.locale all the processing is done by the i18n internationalization module for require.js
